Ramokone Carol Task 4

The first step we open the slack web to get the URL; so that we can able to retrieve the data from the web side which is the name and the time the user send massage in slack platform.

The second step we installed the HtmlAgilityPack this a parser that builds a read/write DOM and support plain XPATH this will allow us to parse out of the web file

```
// See https://aka.ms/new-console-template for more information
Console.WriteLine("Hello, World!");

namespace Scraper
{
    class program
    {
        static void Main(string[] args)
        {
            HtmlAgilityPack.Htmlweb web = new HtmlAgilityPack.Htmlweb()
            HtmlAgility.HtmlDocument doc = web.load(https://api.slack.com/methods/search.messages)
                foreach(var item in doc.DocumentNode.SelectNodes("//[@class='name-date']"))

                    Console.Writeline(item.innerText)
        }
    }
}
```

Lastly this is the code used to perform web scraper for etracting massage for the user and the time they send the massage on the plat form.
